

STAT201B Lecture 5 Sufficiency

1 Sufficiency

Logic

在对 θ 进行 inference 的时候, 我们希望仅将 data 中相关的 information 分离出来, 即在不损失信息的情况下将 data 压缩成 $T(X)$, 这样的好处在于:

1. 提升 computational efficiency
2. 降低 storage requirements
3. 包含 irrelevant information 可能会增加 estimator 的 risk (见 Rao-Blackwell Theorem)
4. 提升数据的 scientific interpretability

1.1 Definition: Sufficient Statistic

Logic

关于 Sufficient Statistics 的更多论述, 见 [STA3020 Lecture 4](#)

令

1. X 的分布来自于 $\mathcal{P} = \{P_\theta : \theta \in \Omega\}$ (一个与 θ 相关的分布族),
2. Statistic T 的 range 为 \mathcal{T}

则 statistic T 被称为 **sufficient**,

若 对于任意 $t \in \mathcal{T}$, conditional distribution $P_\theta(X|T(X) = t)$ 与 θ independent

Example

令 $X_i \stackrel{i.i.d.}{\sim} \text{Ber}(\theta), i = 1, \dots, n$, 则 $T = \sum_{i=1}^n X_i$ 是 θ 的 sufficient statistic:

由于

$$\begin{aligned} P_\theta(X|T(X) = t) &= \frac{P_\theta(X_1, \dots, X_n, T(X) = t)}{P_\theta(T(X) = t)} \\ &= \begin{cases} 0 & \text{if } t \neq \sum_{i=1}^n X_i \\ \frac{P_\theta(X_1=x_1, \dots, X_n=x_n)}{P_\theta(\sum_{i=1}^n x_i=t)} = \frac{\prod_{i=1}^n \theta^{x_i} (1-\theta)^{1-x_i}}{\binom{n}{t} \theta^t (1-\theta)^{n-t}} = \frac{\theta^t (1-\theta)^{n-t}}{\binom{n}{t} \theta^t (1-\theta)^{n-t}} = \frac{1}{\binom{n}{t}} & \text{if } t = \sum_{i=1}^n X_i \end{cases} \end{aligned}$$

与 θ independent, $\forall t \in \mathcal{T}$, T 为 θ 的 sufficient statistic

1.2 Theorem: Neyman Factorization Theorem

Logic

使用定义求解 sufficient statistics 较为繁琐, 可以使用 Neyman Factorization Theorem 快速求解

令 distribution family $\{P_\theta : \theta \in \Omega\}$ 有 joint mass / density $\{p(x; \theta) : \theta \in \Omega\}$

则

$$T \text{ is sufficient for } \theta \iff \exists \text{ functions } h \text{ and } g, \text{ such that } p(x; \theta) = h(x) \cdot g(T(x), \theta)$$

🔗 Proof (仅考虑 discrete case) ✓

Proof. (of Theorem.1.10: Neyman-Fisher Factorization Theorem) We prove the Factorization Theorem for discrete random variables as an illustration, the general proof follow the same line.

- Suppose T is sufficient. We want to prove the right hand side of (1.2). Let $t = T(x)$. The joint pmf. of X is

$$f(x|\theta) = \mathbb{P}_\theta(X = x) = \mathbb{P}_\theta(\{X = x\} \cap \{T = t\})$$

$X=x \text{ 时一定 } T=t$

$$= \mathbb{P}_\theta(X = x|T = t) \mathbb{P}_\theta(T = t) =: h(x)g(t, \theta).$$

- Suppose the right hand side of (1.2) holds. We want to prove T is sufficient. Apparently, when $T(x) \neq t$, we have $\mathbb{P}_\theta(X = x|T = t) = 0$ by definition, which is invariant over θ . Meanwhile, when $T(x) = t$. Let $S = \{x' \in \mathcal{X}_n : T(x') = t\}$. Then

$$\mathbb{P}(X = x|T = t) = \frac{\mathbb{P}_\theta(\{X = x\} \cap \{T = t\})}{\mathbb{P}_\theta(T = t)} = \frac{\mathbb{P}_\theta(\{X = x\})}{\mathbb{P}_\theta(T = t)}$$

$$= \frac{\mathbb{P}_\theta(\{X = x\})}{\{\sum_{x' \in S} \mathbb{P}_\theta(X = x')\}} = \frac{g(t, \theta)h(x)}{\{\sum_{x' \in S} g(t, \theta)h(x')\}} = \frac{h(x)}{\{\sum_{x' \in S} h(x')\}}$$

which is invariant over θ , and conclude that T is sufficient by definition.

≡ Example ✓

令 $Y_i \stackrel{i.i.d.}{\sim} \text{Uniform}(0, \theta), i = 1, \dots, n$

证明: $T = Y_{(n)}$ 为 θ 的 sufficient statistic

$$\begin{aligned} P_\theta(Y) &= \prod_{i=1}^n \left(\frac{1}{\theta}\right) \mathbf{1}(0 < Y_i < \theta) \\ &= \left(\frac{1}{\theta}\right)^n \left[\prod_{i=1}^n \mathbf{1}(0 < Y_i < \theta) \right] \\ &= \left(\frac{1}{\theta}\right)^n \cdot \mathbf{1}(Y_{(1)} > 0) \cdot \mathbf{1}(Y_{(n)} < \theta) \\ &= \mathbf{1}(Y_{(1)} > 0) \cdot \left[\left(\frac{1}{\theta}\right)^n \cdot \mathbf{1}(Y_{(n)} < \theta) \right] \end{aligned}$$

其中 $\mathbf{1}(Y_{(1)} > 0)$ 可以被视为 $h(y)$, $\left(\frac{1}{\theta}\right)^n \cdot \mathbf{1}(Y_{(n)} < \theta)$ 可以被视为 $g(T(y), \theta)$

≡ Example ✓

例 1: $X_1, \dots, X_n \stackrel{i.i.d.}{\sim} \text{Poisson}(\lambda)$, 求 λ 的 sufficient statistic

$$\begin{aligned} f(\mathbf{x}|\lambda) &= \prod_{i=1}^n \left(\frac{\lambda^{x_i} e^{-\lambda}}{x_i!} \cdot \mathbf{1}_{\{x_i \in \mathbb{N}\}} \right) \\ &= \underbrace{\left(\prod_{i=1}^n \frac{1}{x_i!} \cdot \mathbf{1}_{\{x_i \in \mathbb{N}\}} \right)}_{h(\mathbf{x})} \cdot \underbrace{(e^{-n\lambda} \cdot \lambda^{n\bar{x}})}_{g(t, \lambda)} \end{aligned}$$

$$t = \bar{x}, \text{ i.e. } T(\mathbf{X}) = \bar{X}$$

≡ Example ✓

例 2: $X_1, \dots, X_n \stackrel{i.i.d.}{\sim} \text{Bernoulli}(p)$, 其中 $p \in (0, 1)$, 求 λ 的 sufficient statistic

$$\begin{aligned} f(x|p) &= \prod_{i=1}^n (p^{x_i} (1-p)^{1-x_i} \cdot 1_{\{x_i \in \{0, 1\}\}}) \\ &= \underbrace{\left(\frac{p}{1-p}\right)^{n\bar{x}} \cdot (1-p)^n}_{g(t, \theta)} \cdot \underbrace{\left[\prod_{i=1}^n 1_{\{x_i \in \{0, 1\}\}}\right]}_{h(x)} \\ t &= \bar{x}, \text{ i.e. } T(X) = \bar{X} \end{aligned}$$

Example

例 3: $X_1, \dots, X_n \stackrel{i.i.d.}{\sim} N(\mu, \sigma^2)$, 其中 $\mu \in \mathbb{R}, \sigma^2 \in \mathbb{R}^+$. 求下述情况下 θ 的 sufficient statistic

① μ 未知, σ^2 已知, $\theta = \mu$

$$\begin{aligned} f(x|\theta) &= \prod_{i=1}^n \left\{ (2\pi\sigma^2)^{-\frac{1}{2}} \exp\left(-\frac{(x_i-\mu)^2}{2\sigma^2}\right) \right\} \\ &= \underbrace{\left[\frac{\exp\left(-\frac{\sum x_i^2}{2\sigma^2}\right)}{(2\pi\sigma^2)^{n/2}} \right]}_{h(x)} \cdot \underbrace{\exp\left\{-\frac{n\mu^2 - 2n\mu\bar{x}}{2\sigma^2}\right\}}_{g(t, \theta)} \end{aligned}$$

$$t = \bar{x}, \text{ i.e. } T(X) = \bar{X}$$

② μ 已知, σ^2 未知, $\theta = \sigma^2$

$$\begin{aligned} f(x|\theta) &= \prod_{i=1}^n \left\{ (2\pi\sigma^2)^{-\frac{1}{2}} \exp\left(-\frac{(x_i-\mu)^2}{2\sigma^2}\right) \right\} \\ &= \underbrace{\frac{1}{(2\pi\sigma^2)^{n/2}} \cdot \exp\left\{-\frac{n \cdot \left(\frac{\sum (x_i-\mu)^2}{n}\right)}{2\sigma^2}\right\}}_{g(t, \theta)} \end{aligned}$$

$$t = \frac{1}{n} \sum_{i=1}^n (x_i - \mu)^2, \text{ i.e. } T(X) = \frac{1}{n} \sum_{i=1}^n (X_i - \mu)^2$$

③ μ, σ^2 未知, $\theta = (\mu, \sigma^2)$

$$\begin{aligned} f(x|\theta) &= \prod_{i=1}^n \left\{ (2\pi\sigma^2)^{-\frac{1}{2}} \exp\left(-\frac{(x_i-\mu)^2}{2\sigma^2}\right) \right\} \\ &= (2\pi\sigma^2)^{-\frac{n}{2}} \exp\left\{-\frac{1}{2\sigma^2} \left[\frac{n}{n} (x_i - \bar{x})^2 + n(\bar{x} - \mu)^2 \right]\right\} \\ &= \underbrace{(2\pi\sigma^2)^{-\frac{n}{2}} \exp\left\{-\frac{1}{2\sigma^2} [(n-1)S^2 + n(\bar{x} - \mu)^2]\right\}}_{g(t, \theta)} \quad \left(S^2 = \frac{\sum (x_i - \bar{x})^2}{n-1}\right) \end{aligned}$$

$$T(X) = (S^2, \bar{X})$$

1.3 Theorem: Rao-Blackwell Theorem

Logic

关于 loss, risk, admissibility, Rao-Blackwell Theorem 的更多描述, 见 [STA3020 Lecture 5](#)

令:

- X 为分布为 $P_\theta \in \mathcal{P} = \{P_\theta, \theta \in \mathbb{R}\}$ 的随机变量
- $\delta(X)$ 为 θ 的 (任意) 一个 estimator

若:

- $T(X)$ 为 θ 的一个 **sufficient** statistic
- Loss function $\mathcal{L}(\theta, \delta(X))$ 为关于 θ 的 **strictly convex** function (如 L_2 loss)
- $\delta(X)$ 有 finite expectation 与 risk, 即 $R(\theta, \delta(X)) = \mathbb{E}[\mathcal{L}(\theta, \delta(X))] < \infty$

则:

- 若定义 $\eta(t) = E_{\theta}[\delta(X)|T=t], \forall t$ (即 $\delta(X)$ 在 T 下的条件期望, 是一个关于 T 的函数)
- 则 estimator $\eta(T) = E_{\theta}[\delta(X)|T(X)]$ 满足:

$$R(\theta, \eta) < R(\theta, \delta)$$

除非 $\delta(X) = \eta(T)$ with probability 1

⚠ Remark ▾

1. 若 strictly convex 被替换为 convex, 则 $<$ 被替换为 \leq , 但是若去除 convexity assumption, 则定理不成立
2. 此处 T 被要求为 sufficient statistic, 这主要是为了**确保 $\eta(T)$ independent with θ** (因此可以被视作一个 estimator)
3. Rao-Blackwell theorem 的实际意义在于: 我们**可以通过 conditioning on sufficient statistics 来优化现有的 estimator**

⚡ Proof ▾

由 Jensen's inequality, 有

$$\begin{aligned}\mathcal{L}(\theta, \eta(t)) &= \mathcal{L}(\theta, E[\delta(X)|T(X)=t]) \\ &\leq E[\mathcal{L}(\theta, \delta|T(X)=t)]\end{aligned}$$

当且仅当 $\theta = \eta(t)$ with probability 1 时取等;
对两侧取期望, 有:

$$R(\theta, \eta) = E[\mathcal{L}(\theta, \eta)] \leq E[E[\mathcal{L}(\theta, \delta(X)|T)]] = R(\theta, \delta)$$

≡ Example: 对 MSE 的优化 ▾

考虑 estimator δ 和 L2 loss $\mathcal{L}(\theta, \delta) = (\theta - \delta)^2$, 则经过 Rao-Blackwell 优化过的 estimator $\eta = E_{\theta}[\delta|T]$ 满足:

$$\begin{aligned}R(\theta, \eta) &= E_{\theta}[\mathcal{L}(\theta, \eta)] \\ &= E_{\theta}[(\theta - E_{\theta}[\delta|T])^2] \\ &= E_{\theta}[E_{\theta}[(\theta - \delta|T])^2] \quad (\text{conditional on } \theta, \text{ 可以将 } \theta \text{ 视作常数放入期望}) \\ &\leq E_{\theta}[E_{\theta}[(\theta - \delta)^2|T]] \quad (\text{Jensen's inequality}) \\ &= E_{\theta}[(\theta - \delta)^2] \\ &= R(\theta, \delta)\end{aligned}$$

1.4 Jensen's Inequality

令:

1. $(\Omega, \mathcal{F}, \mathbb{P})$ 为一个 probability space
2. $X: \Omega \rightarrow \mathbb{R}$ 为一个 integrable random variable (即 $E[|X|] < \infty$)

若:

1. $\varphi: \mathbb{R} \rightarrow \mathbb{R}$ 为 **convex** function
2. $\varphi: \mathbb{R} \rightarrow \mathbb{R}$ 为 integrable

则:

$$\varphi(E[X]) \leq E[\varphi(X)]$$

⚠ Remark ▾

若 φ 为 strictly convex, 则当且仅当 X is almost surely constant 时取等

≡ Example ▾

$$(\mathbb{E}[X])^2 \leq \mathbb{E}[X^2]$$
