

STAT230A Lecture 17 Leave-One-Out Formula (Application 1)

Logic ▾

对于 leave-one-out formula

$$\hat{\beta}_{[-i]} = \hat{\beta} - \frac{1}{1 - h_{ii}} (X^\top X)^{-1} x_i \hat{\epsilon}_i$$

其可被用于:

- Gauss Update Formula
- Outlier Detection

1 Leave-One-Out Formula 的 Application: Gauss Updating Formula

1.1 Definition: Predicted Residual

Predicted residual $\hat{\epsilon}_{[-i]}$ 被定义为

$$\hat{\epsilon}_{[-i]} = y_i - x_i^\top \hat{\beta}_{[-i]}$$

即表示用 (x_i, y_i) 之外的数据得到的 regression fit 在 (x_i, y_i) 上的 residual

1.2 Theorem: Predicted Residual 和 Regression Residual 的关系

Predicted residual 和 regression residual 存在以下关系:

$$\hat{\epsilon}_{[-i]} = \frac{\hat{\epsilon}_i}{1 - h_{ii}}$$

⚠ Remark: Intuition ▾

由于 $h_{ii} \in (0, 1)$, 可以得出 predicted residual 大于 regression residual

Intuitively, 对于一般 residual $\hat{\epsilon}_i$, 由于 (x_i, y_i) 参与了 model fitting, 模型会向该点 "靠近", 因此 residual 相较于 leave-one-out regression 会被压缩

若 observation i 的 leverage h_{ii} 很大, 则其会使模型更加 "靠近" 该点, 因此 residual 会被进一步压缩

↪ Proof ▾

使用 leave-one-out formula, 则 predicted residual 可被改写为:

$$\begin{aligned}\hat{\epsilon}_{[-i]} &= y_i - x_i^\top \hat{\beta}_{[-i]} \\ &= y_i - x_i^\top \left(\hat{\beta} - \left(\frac{1}{1 - h_{ii}} \right) (X^\top X)^{-1} x_i \hat{\epsilon}_i \right) \\ &= \underbrace{y_i - x_i^\top \hat{\beta}}_{\hat{\epsilon}_i} + \frac{1}{1 - h_{ii}} \underbrace{x_i^\top (X^\top X)^{-1} x_i}_{h_{ii}} \hat{\epsilon}_i \\ &= \hat{\epsilon}_i + \frac{h_{ii}}{1 - h_{ii}} \hat{\epsilon}_i \\ &= \frac{\hat{\epsilon}_i}{1 - h_{ii}}\end{aligned}$$

1.3 Theorem: Gauss Updating Formula

Logic

假设数据 (x_i, y_i) 为 sequentially observed, 我们希望利用 time n 时刻的 regression fit 快速求出 $n+1$ 时刻的 regression fit

考虑 sequential data, 令 time n 时的 data 和 regression fit 为:

$$\begin{aligned} \bullet X_{(n)} &= \begin{bmatrix} x_1^\top \\ \vdots \\ x_n^\top \end{bmatrix} \\ \bullet Y_{(n)} &= \begin{bmatrix} y_1 \\ \vdots \\ y_n \end{bmatrix} \\ \bullet \hat{\beta}_{(n)} &= (X_{(n)}^\top X_{(n)})^{-1} X_{(n)}^\top Y_{(n)} \end{aligned}$$

则 time $n+1$ 时的 regression fit 为:

$$\hat{\beta}_{(n+1)} = \hat{\beta}_{(n)} + \gamma_{(n+1)} \hat{\varepsilon}_{[-(n+1)]}$$

其中

$$\begin{aligned} \gamma_{(n+1)} &= [X_{(n+1)}^\top X_{(n+1)}]^{-1} x_{n+1} \\ \hat{\varepsilon}_{[-(n+1)]} &= y_{n+1} - x_{n+1}^\top \hat{\beta}_{(n)} \end{aligned}$$

Proof

使用 leave-one-out formula, 并结合 predicted residual 和 regression residual 的关系, 有

$$\begin{aligned} \hat{\beta}_{(n)} &= \hat{\beta}_{(n+1)} - \frac{1}{1 - h_{n+1, n+1}} [X_{(n+1)}^\top X_{(n+1)}]^{-1} x_{n+1}^\top \hat{\varepsilon}_{n+1} \\ &= \hat{\beta}_{(n+1)} - \left[\frac{\hat{\varepsilon}_{n+1}}{1 - h_{n+1, n+1}} \right] [X_{(n+1)}^\top X_{(n+1)}]^{-1} x_{n+1} \\ &= \hat{\beta}_{(n+1)} - \hat{\varepsilon}_{[-(n+1)]} \gamma_{(n+1)} \end{aligned}$$

Logic

但上述对 γ 的计算中涉及 matrix inversion $(X_{(n+1)}^\top X_{(n+1)})^{-1}$, 我们希望使用已知的 matrix inversion $(X_{(n)}^\top X_{(n)})^{-1}$

1.4 对 Gauss Updating Formula 的改进

记:

$$V_{(n)} = (X_{(n)}^\top X_{(n)})^{-1}$$

则可利用其快速求解 $V_{(n+1)}$:

$$V_{(n+1)} = V_{(n)} - \left(\frac{1}{1 + x_{n+1}^\top V_{(n)} x_{n+1}} \right) V_{(n)} x_{n+1} x_{n+1}^\top V_{(n)}$$

Proof

由于第 $n+1$ 个 observation 加入后, 有

$$X_{(n+1)}^\top X_{(n+1)} = X_{(n)}^\top X_{(n)} + x_{n+1} x_{n+1}^\top$$

因此

$$V_{(n+1)} = \left(X_{(n+1)}^\top X_{(n+1)} \right)^{-1} = \left(X_{(n)}^\top X_{(n)} + x_{n+1} x_{n+1}^\top \right)^{-1}$$

使用 Sherman–Morrison formula:

$$(A + uv^\top)^{-1} = A^{-1} - \frac{A^{-1}uv^\top A^{-1}}{1 + v^\top A^{-1}u},$$

令

$$A = X_{(n)}^\top X_{(n)}, \quad u = x_{n+1}, \quad v = x_{n+1},$$

则

$$V_{(n+1)} = A^{-1} - \frac{A^{-1}x_{n+1}x_{n+1}^\top A^{-1}}{1 + x_{n+1}^\top A^{-1}x_{n+1}}.$$

代入 $A^{-1} = V_{(n)}$, 即可得到

$$V_{(n+1)} = V_{(n)} - \left(\frac{1}{1 + x_{n+1}^\top V_{(n)} x_{n+1}} \right) V_{(n)} x_{n+1} x_{n+1}^\top V_{(n)}$$

Logic ▾

结合上述结论, 我们可以得到 Gauss update algorithm

1.5 Gauss Update Algorithm

Step 1: 计算和前 n 个 observations 相关的 quantities

利用前 n 个 observations 计算:

$$V_{(n)} = (X_{(n)}^\top X_{(n)})^{-1} \quad \hat{\beta}_{(n)} = (X_{(n)}^\top X_{(n)})^{-1} X_{(n)}^\top Y_{(n)}$$

Step 2: 使用 Sherman-Morrison formula

观测 (x_{n+1}, y_{n+1}) , 并计算:

$$V_{(n+1)} = V_{(n)} - \left(\frac{1}{1 + x_{n+1}^\top V_{(n)} x_{n+1}} \right) V_{(n)} x_{n+1} x_{n+1}^\top V_{(n)}$$

Step 3: 计算 Gauss updating formula 所需要的 quantities

计算:

$$\begin{aligned} \gamma_{(n+1)} &= V_{(n+1)} x_{n+1} \\ \hat{\varepsilon}_{[-(n+1)]} &= y_{n+1} - x_{n+1}^\top \hat{\beta}_{(n)} \end{aligned}$$

Step 4: 使用 Gauss updating formula

计算:

$$\hat{\beta}_{(n+1)} = \hat{\beta}_{(n)} + \gamma_{(n+1)} \hat{\varepsilon}_{[-(n+1)]}$$
